

AI Prompts

03/02/2025 15:45 Change the winning score to contain a constant named something like `WINNING_SCORE` which is (initially) set to 104. All other classes should reference the constant and not a specific number.

I gave it access to `play.java`, `playScreen.java`, and `prog6.java`

03/02/2025 15:56 Create a new class called `Dice` that contain one random number generator. It should take in N number of sides for the dice. Make sure it also has a method called `roll` which produces a random number from 1 to N

I gave it access to no other classes

03/02/2025 16:12 Have all players use this dice class instead of rolling a number 1-6

I have it access to all `player.java` classes

03/02/2025 16:20 Reorganize to make sure there is only one class per file

I gave it access to all files in the `Bulldog` src folder

Report on Improvement 1

The AI made this change very easily and efficiently. I had to do no debugging with this improvement. For time comparison I strongly believe that a human could have done this improvement in a similar amount of time to an AI. The factors I include in that statement would be time to write the code and time to prompt the AI. It takes more time to type out the prompt I used to give the AI than it would to make those changes. It also took the AI roughly 30 seconds give or take to actually generate those edits. It took an additional 30 seconds to apply those changes and save them. If the person making this program was inexperienced and did not know Java or what they were doing, the AI would have proven to be significantly faster.

Report on Improvement 2

During this stage of improvements the AI managed to compete with birds with one stone to say. Although the AI was not prompted to create `JavaDoc` for this class it still did. I explain more on why I believe this happened in the next section. Overall time it took to complete this step was much faster than it would take me to do this by hand. It was a bonus to this step was it able to generate the `JavaDoc` formatted with the `*/`'s better than it has in the past. When reviewing the code for the implementation I noticed this disruption with the `*/`.

Report on Improvement 3

Although we were asked to give the AI this prompt. It was unnecessary for me to do so. When I prompted the AI to make the new dice class and make other changes it automatically provided the `JavaDoc`. The reasoning behind this is most likely due to the fact that it still has access to the previous logs for improvements made on this project.

Report on Improvement 4

When I prompted the AI to reorganize the code so only one class is in each file. The AI made no changes. It claimed to have made changes but when looking to see the changes made there were none. This was an interesting response. The AI made no changes but yet it claimed to have done so. I am curious as to why it did not respond with all files having one class or something else along those lines.

General Report

In conclusion to this assignment, I found it extremely easy to complete. I spent the least amount of time completing this assignment thus far. The overall time it took me to complete the code section of this assignment was roughly around 30 minutes. That is including time to prompt the AI and the time it took to “debug”. Comparatively to the other assignments there was no time spent reprompting or hand fixing code that the AI created. I believe a strong factor in this was due to the simplicity of the tasks given. The largest time I spent on this assignment was the time it took to write out the report.

I did not encounter any challenges during this assignment. The easiest part was prompting the AI to make changes. If I were to do this assignment again I would like to do everything by hand. I enjoy the challenge of coding and enjoy writing the code myself. Another thing I would do if I were to do this assignment again would be to use a stopwatch and time from the time when I start prompting the AI to when I am done debugging it.
