

AI Prompts

Game Status

04/16/2025 10:57

in GameState.java have a method called get roll value, get turn total, and get currentscore, add a constructor

The AI was able to complete this with little issues. It was able to create a constructor but it did not originally have any parameters. I choose to manually do it to save giving the AI another prompt.

Refactoring

04/16/2025 12:31

Refactor the code to have a global play method in the Player class. Do this to eliminate duplicate code. Also have a continue method that is determined based on each player class
I gave it access to Player.java and all Player classes but Human Player

After this prompt the AI was able to half complete this task. It was able to create a method called continueTurn but it did not completely eliminate all the duplicate code. In some classes it kept the play() method, in others it removed it. I went in and manually removed the extra play methods because they are no longer needed.

04/16/2025 12:36

Add seven player to be an option
I gave it access to home.java

During testing in the previous step I realized that seven player was never fully implemented. So I made sure that the user could choose seven player as a player option. The AI was able to complete this task with no issues.

04/16/2025 12:52

In seven Player add a constructor that takes in one parameter String Name
I gave it access to SevenPlayer.java

The AI was able to complete this task with no issues. During this step I came across a curiosity or conundrum. The way we originally set up SevenPlayer we needed similar fake randomness. Due to this the way it was implemented it uses a different dice compared to all the other classes. Additionally with the way SevenPlayer was set up with a seed it will roll the same thing every single time. With the way SevenPlayer is currently set up it does not meet the requirement to be a candidate to fit the strategy pattern. This is due to the fact that we use a fake random dice and in the new play method we roll inside of that play method.

HumanPlayer Continue

04/16/2025 12:59

Implement the continue method for the HumanPlayer.java class.

The AI was able to complete this step with zero issues. It was able to implement the continue method in a similar way to all the other classes.

Continue Methods

FifteenPlayer

```
@Override
protected boolean continueTurn(int total) {
    if (total < 15) {
        System.out.println(" player score is not above 15 so player is continuing. Player is at " + total + " for the turn so far.");
        return true;
    } else {
        System.out.println(" player score is above 15 so player is not continuing. Player is at " + total + " for the turn.");
        return false;
    }
}
```

HumanPlayer

```
@Override
protected boolean continueTurn(int total) {
    int userInput = JOptionPane.showConfirmDialog(parentComponent:null, "You rolled. Your total is " + total + ". Do you want to continue rolling?",
        title:"Continue Rolling?", JOptionPane.YES_NO_OPTION);
    if (userInput == JOptionPane.YES_OPTION) {
        System.out.println(" and choosing to continue, scoring " + total + " for the turn so far.");
        return true;
    } else {
        System.out.println(" and choosing not to continue, scoring " + total + " for the turn.");
        return false;
    }
}
```

RandomPlayer

```
@Override
protected boolean continueTurn(int total) {
    int chance = Dice.getInstance(sides:2).roll(); // Randomly choose to continue or not
    if (chance == 1) {
        System.out.println(" and is randomly choosing to continue. Player is at " + total + " for the turn so far.");
        return true;
    } else {
        System.out.println(" and randomly chose not to continue, scoring " + total + " for the turn.");
        return false;
    }
}
```

SevenPlayer

```
@Override
protected boolean continueTurn(int total) {
    if (total < 7) {
        System.out.println(" player score is not above 7 so player is continuing. Player is at " + total + " for the turn so far.");
        return true;
    } else {
        System.out.println(" player score is above 7 so player is not continuing. Player is at " + total + " for the turn.");
        return false;
    }
}
```

UniquePlayer

```

@Override
protected boolean continueTurn(int total) {
    if (total <= 12) {
        System.out.println(" player score is not above 12 so player is continuing. Player is at " + total + " for the turn so far.");
        return true;
    } else {
        int chance = Dice.getInstance(sides:2).roll(); // Randomly choose to continue or not
        if (chance == 1) {
            System.out.println(" player score is above 12 and is randomly choosing to continue. Player is at " + total + " for the turn so far.");
            return true;
        } else {
            System.out.println(" player score is above 12 and is randomly choosing not to continue. Player is at " + total + " for the turn.");
            return false;
        }
    }
}
}

```

WimpPlayer

```

@Override
protected boolean continueTurn(int total) {
    System.out.println(" and chose not to continue, scoring " + total + " for the turn.");
    return false;
}

```

Reflection

Overall I thought this assignment was easier than expected. I felt like I spent the least amount of time prompting the AI. However I feel like I spent more time making sure things were synced and implemented properly. I felt as though the AI's solution was too good to be correct. As mentioned in above I spent time removing the extra play method that it did not remove from all classes. When I initially saw that my first thought was that the AI did not actually implement the continue and play method correctly. However, with some testing I was able to find out that it was really just excess code. This checking process was the longest part of this assignment. I did not have to spend much time actually debugging. You could technically call the checking process debugging, but I felt as if it was more so a checking and understanding process.

Time Management

As I stated in my reflection I felt as though I spent the least amount of time on this assignment.

AI Prompting	15 minutes
Debugging	5 minutes
Testing	10 minutes
Checking for Proper implementation	25 minutes
Writing Lab Report	20 minutes
Total	1 Hour 15 Minutes
